

Controll Developement

Erik Jonsson Thorén

March 11, 2013

Introduction

This document specifies the goals for the Controll project. It also includes some diagrams over different models and message routing specifications.

`http://github.com/thecopy/Controll`

Milestones

Note that none of these versions have been released as of this date and this document is a weak specification.

Controll 0.0.1

The 0.0.1 version of Controll will be a prototype of the fundamental communications between a client and a zombie.

- Simple Authentication.
- Activate simple activity¹ from a client
- Register Zombie
- Register User
- Fetch Zombie Information
 - Installed Activities

Controll 0.0.2

Changes from 0.0.1:

- Message queue, MQ, offline support²
- Message delivery verification³

See appendix A2 for a specification of the message routing in 0.0.2 for a clear overview of how the offline queue support is specified to be implemented.

¹A terminating response from the activity. No further dialog between client and the activity.

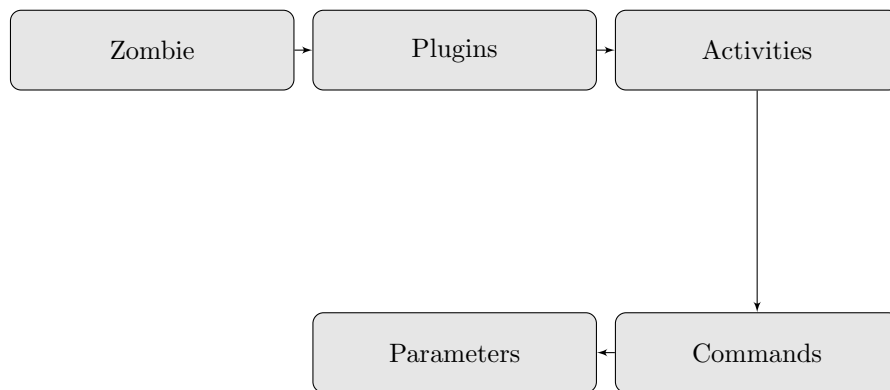

²A message to a zombie or a client will wait until the zombie or client becomes online and then deliver the message

³Ties in very neatly with the MQ offline support

Appendix

A1. The Zombie Model

The arrow represents *have many*.

A2. The messaging specification model in 0.0.2

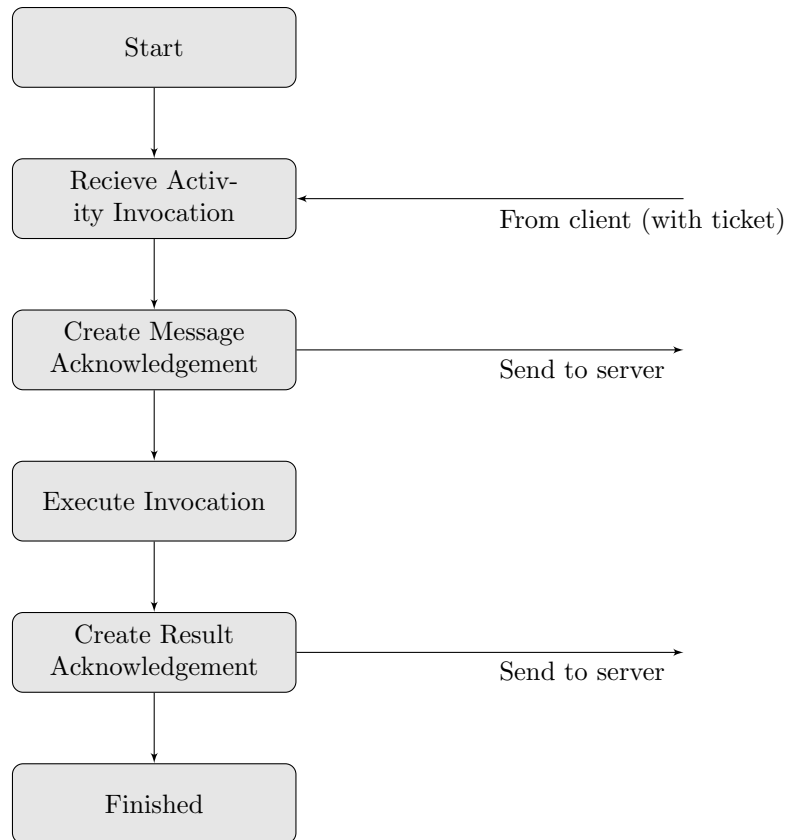

These three flow charts shows the specification for the message routing between the client, the server and the zombie when the user invokes an activity on the zombie.

Note: Due to the implementation of SignalR (the abstracted transport) we will always get an acknowledgement whether what we send to the server is received or not.

The Client

The Zombie

The Server
